

Validation of national methane mid-infrared prediction equation

Maria Frizzarin, Ben Lahart, and Donagh Berry

Teagasc, Ireland

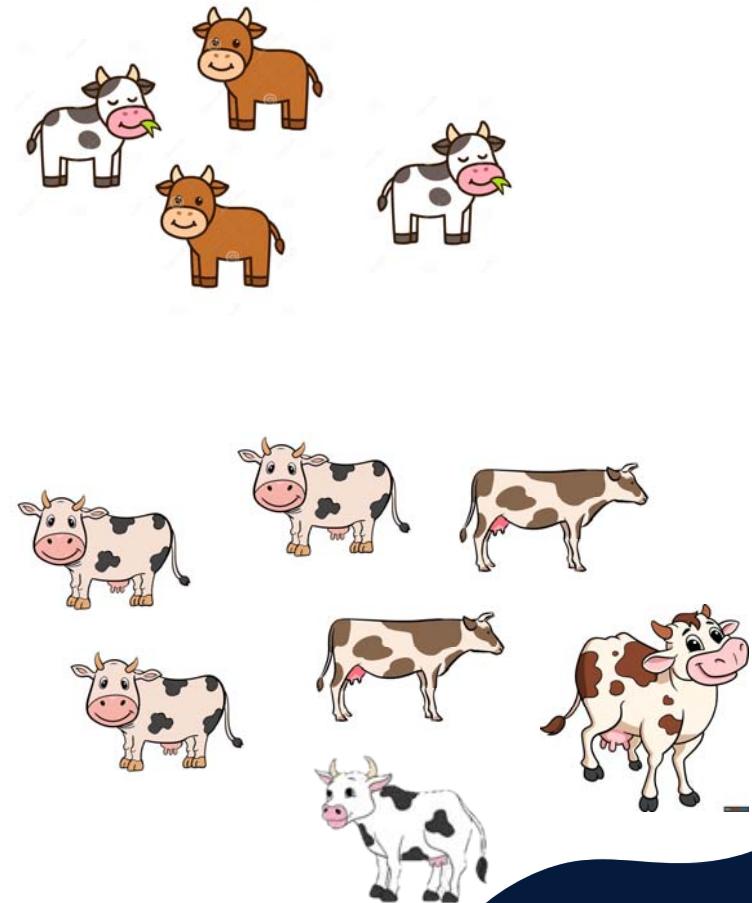

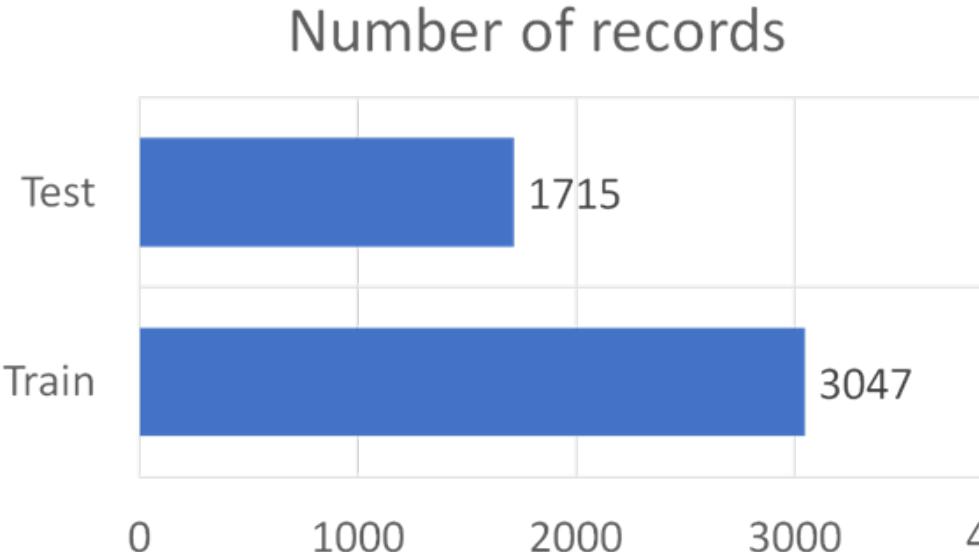

Maria.frizzarin@teagasc.ie

FUNDED BY:

Objective

Predicting methane emissions of individual grazing dairy cows from spectral analyses of their milk samples

Donagh Berry, M. Frizzarin, B. Lahart, M. Kennedy, L. Shalloo, M. Egan, K. Starsmore, S. McParland

Teagasc, Ireland

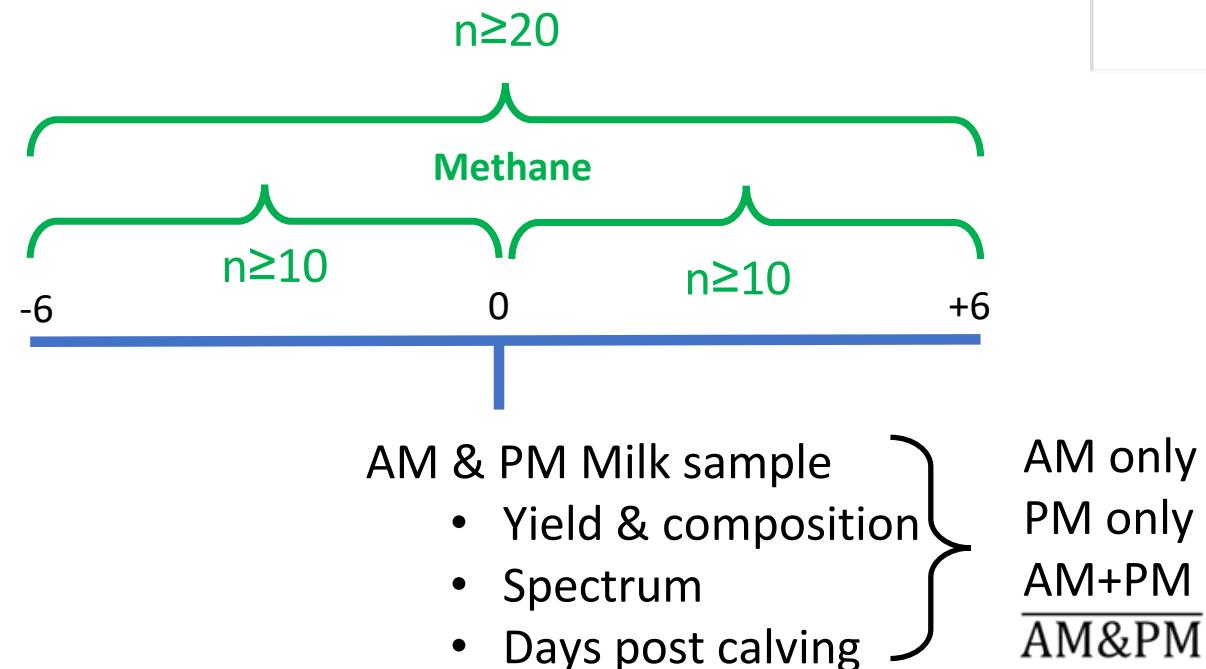

Donagh.berry@teagasc.ie

Data

- 93,888 individual methane spot measures (>2 minutes)
 - 384 lactations from 277 dairy cows

Approach

Four fold cross-validation

One farm out

$$\text{Methane} = \int (\text{spectrum, days in milk, yield, fat\%, protein \%})$$

Partial least squares or neural networks

Results

- $\mu = 323.4 \text{ g/d}$
- $\sigma = 75.2 \text{ g/d}$
- Average of 30 spot measures to ± 6 days
 - 111 minutes
- Repeatability = 28%
- Little difference
 - AM v PM, neural networks v partial least squares
- Flanking 6 days > previous 6 days > subsequent 6 days

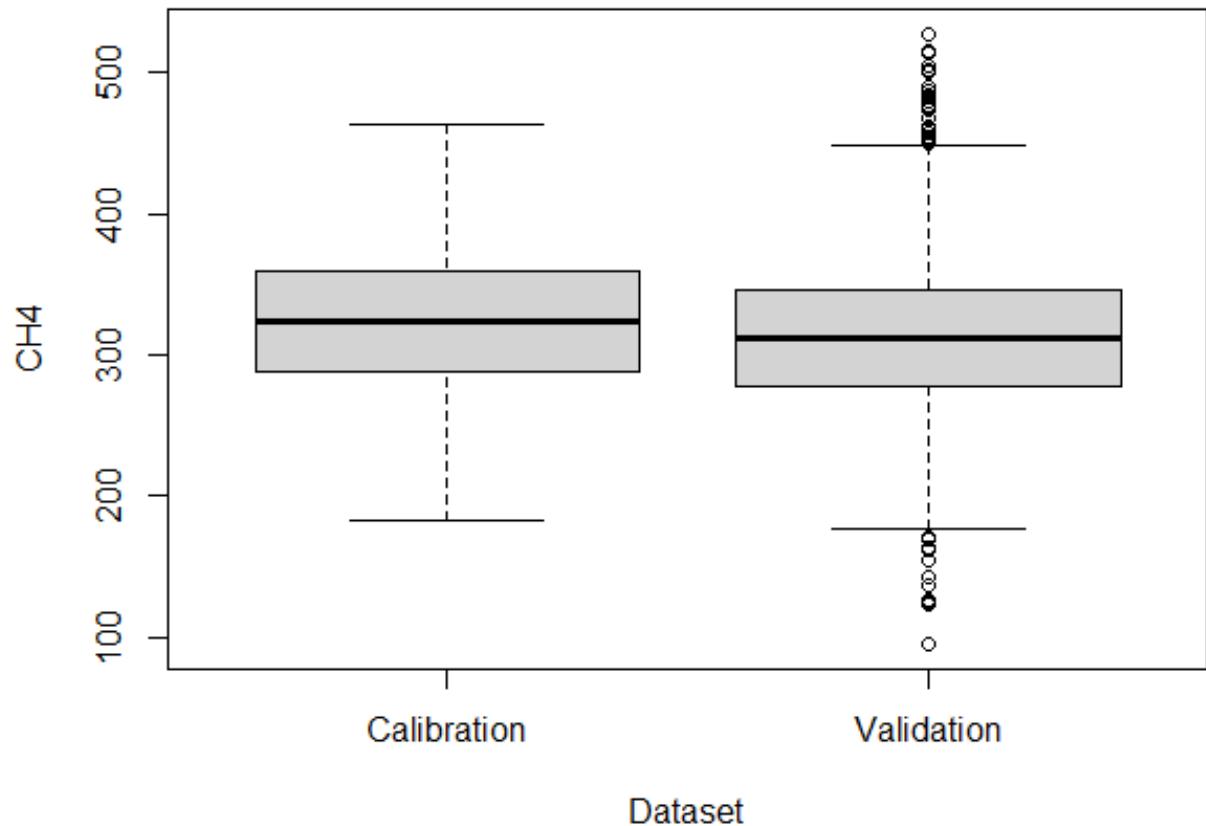

Results

Model	No spectra	With spectra
Spectra		0.55 (0.07)
DIM	0.32 (0.13)	0.55 (0.06)
Yield	0.10 (0.18)	0.64 (0.05)
Composition	0.32 (0.13)	0.57 (0.06)
DIM + yield	0.52 (0.10)	0.64 (0.06)
DIM + composition	0.41 (0.10)	0.55 (0.06)
Yield + composition	0.32 (0.07)	0.62 (0.05)
DIM + yield + composition	0.54 (0.09)	0.64 (0.05)

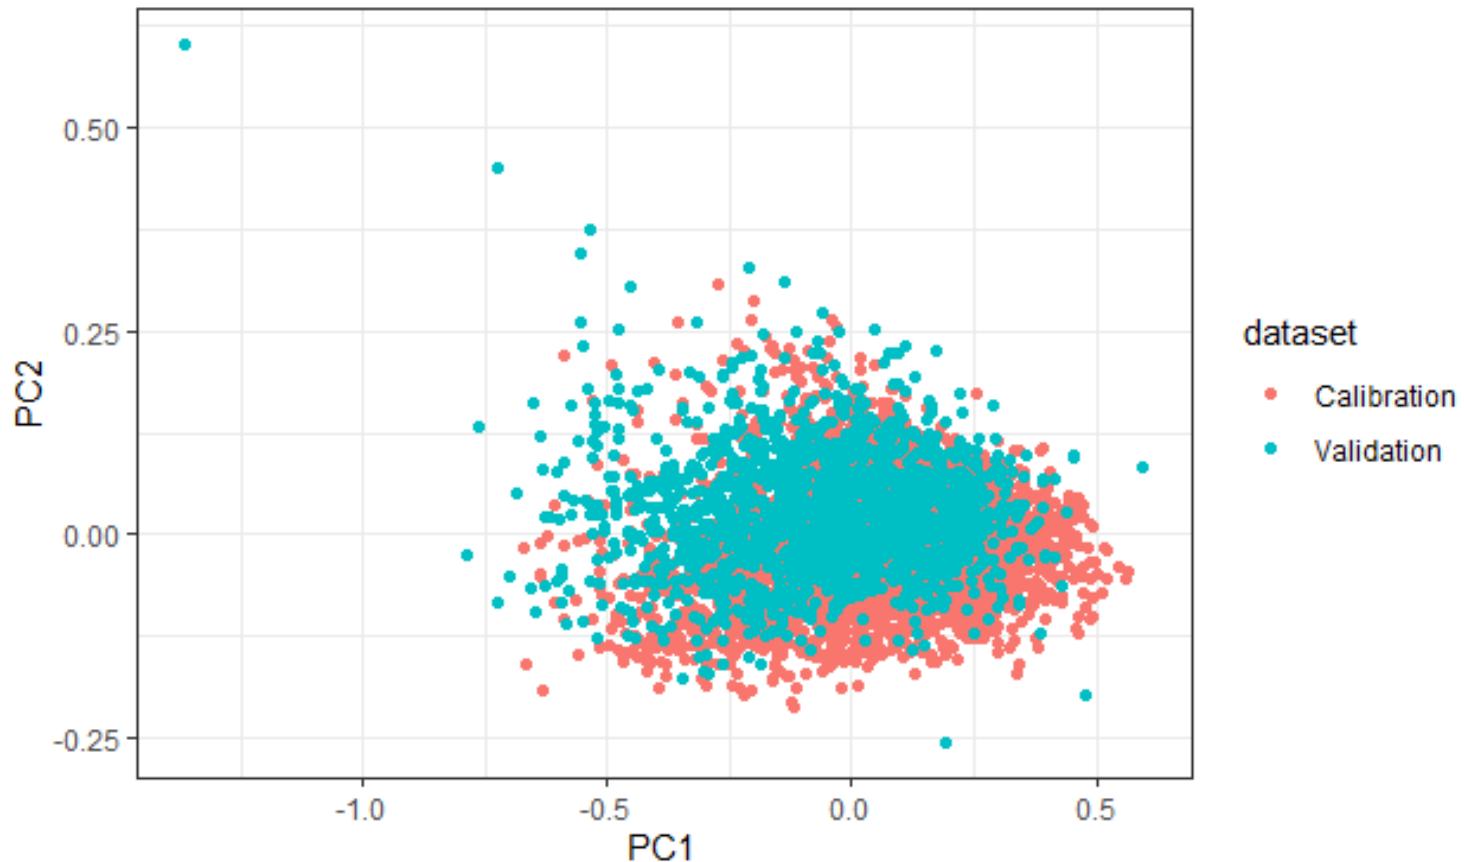

Validation dataset

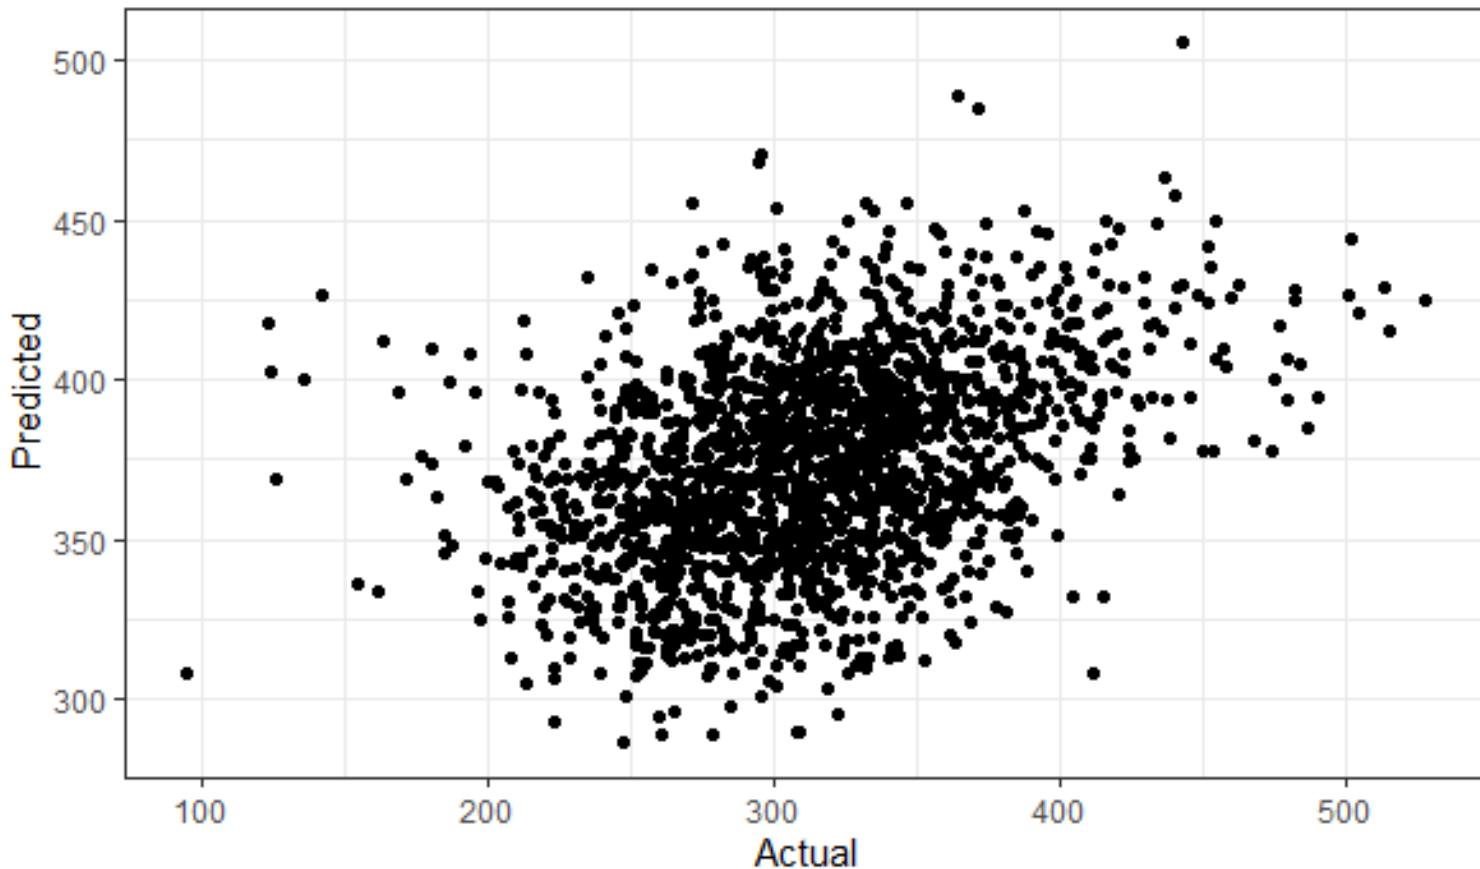

- Calibration
 - N = 3,047
 - From 2020 to 2022
- Validation
 - N = 1,715
 - From 2023

Validation dataset

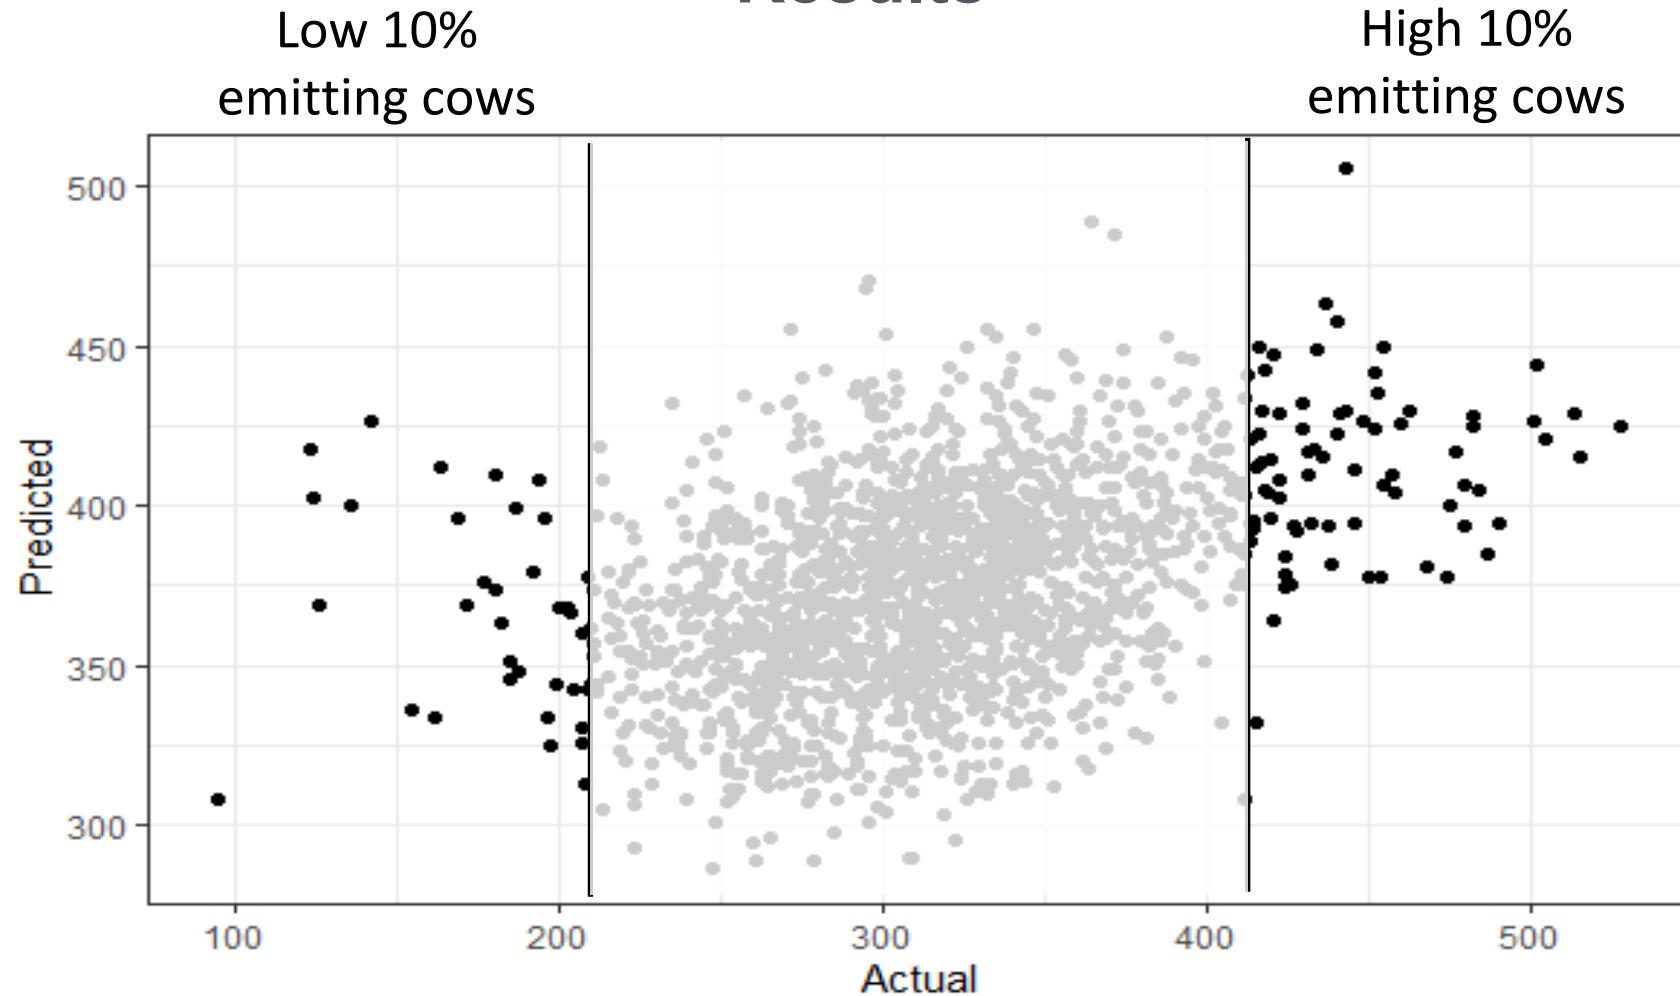

Results

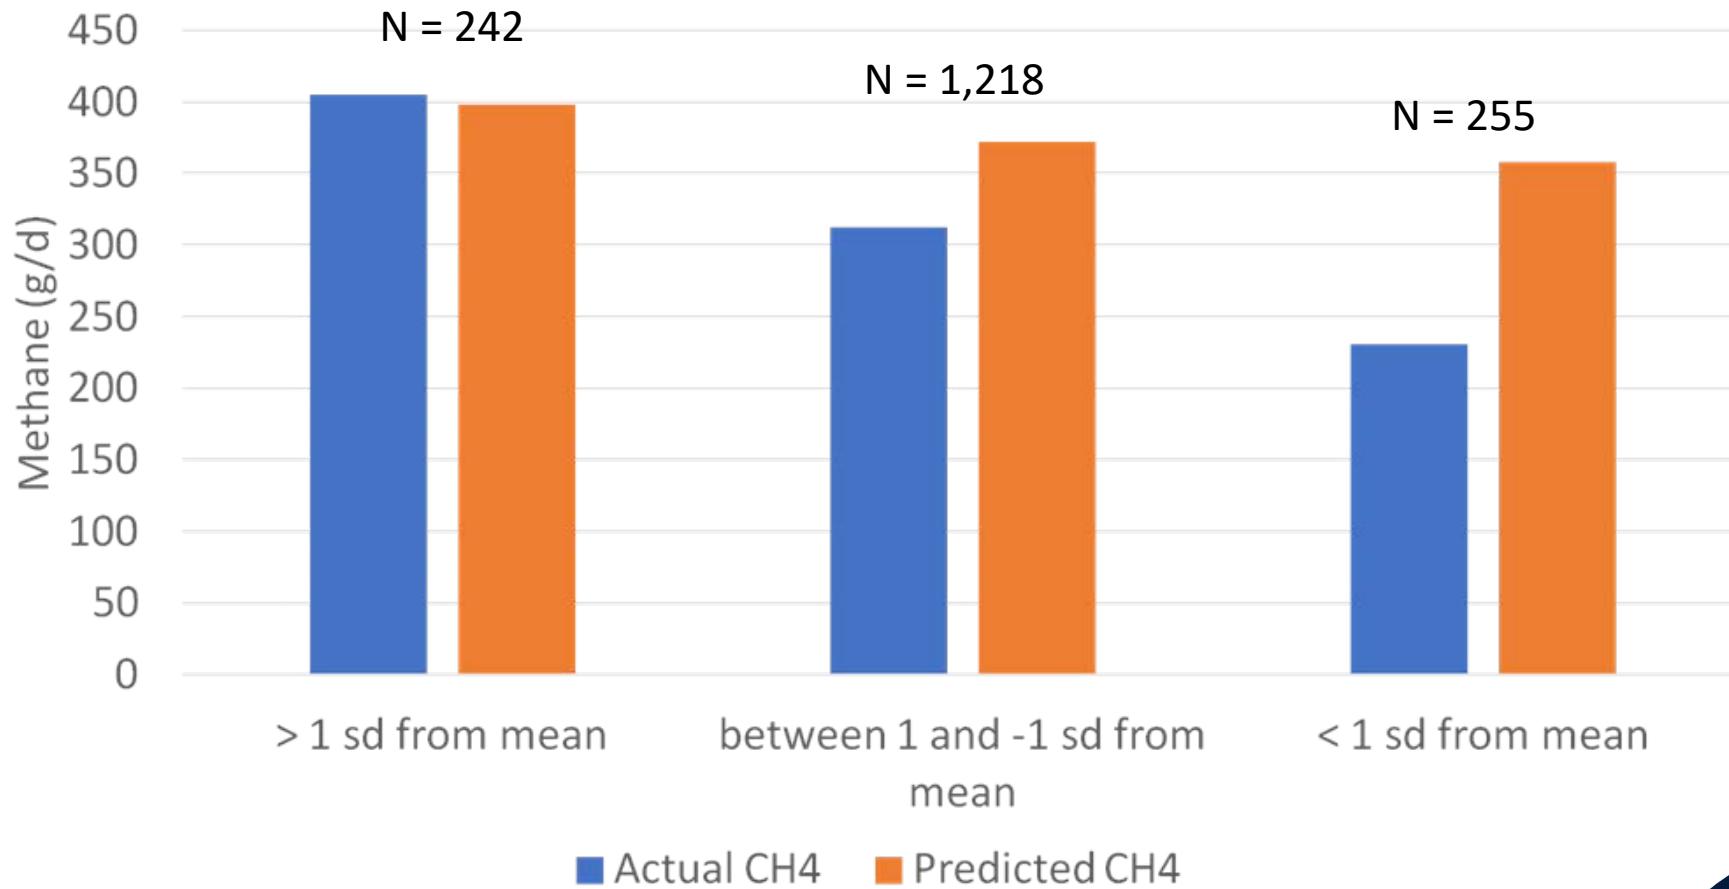

- Correlation between actual and predicted of 0.38 *
- Root mean square error of 78.76 g/d

* Correlation in the training dataset of 0.64

Results

Results

Conclusions

- Accuracy of the prediction relatively low
- Ability in identify high and low emitting cows
- Ability in identifying groups of cows
